

Tiger Grass *Thysanolaena latifolia*

Height: 8 feet

Spread: 10 feet

Sunlight: ☐ ☒ ☒

Hardiness Zone: 9b

Other Names: form. *Thysanolaena maxima*, Nepalese Broom Grass

Description:

A clump forming grass with large, bamboo-like green leaves on tall, solid culms; green flowers in late summer mature to golden brown; provide full sun on the coast, light shade inland, with occasional to regular water; gives a tropical feel to the garden

Ornamental Features

Tiger Grass's attractive large textured sword-like compound leaves remain light green in color throughout the year on a plant with an upright spreading habit of growth. It features airy spikes of green frilly flowers rising above the foliage from early to mid summer. The dark brown seed heads are carried on plumes from late summer to mid fall.

Landscape Attributes

Tiger Grass is a spreading evergreen perennial grass with an upright spreading habit of growth. Its relatively coarse texture can be used to stand it apart from other garden plants with finer foliage.

This plant will require occasional maintenance and upkeep, and should not require much pruning, except when necessary, such as to remove dieback. Deer don't particularly care for this plant and will usually leave it alone in favor of tastier treats. Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Spreading

Tiger Grass is recommended for the following landscape applications;

Planting & Growing

Tiger Grass will grow to be about 8 feet tall at maturity, with a spread of 10 feet. It has a low canopy with a typical clearance of 1 foot from the ground. It grows at a fast rate, and under ideal conditions can be expected to live for approximately 10 years. As an evergreen perennial, this plant will typically keep its form and foliage year-round.

This plant performs well in both full sun and full shade. However, you may want to keep it away from hot, dry locations that receive direct afternoon sun or which get reflected sunlight, such as against the south side of a white wall. It is very adaptable to both dry and moist locations, and should do just fine under typical garden conditions. This plant should not require much in the way of fertilizing once established, although it may appreciate a shot of general-purpose fertilizer from time to time early in the growing season. It is not particular as to soil pH, but grows best in sandy soils, and is able to handle environmental salt. It is somewhat tolerant of urban pollution. Consider applying a thick mulch around the root zone in both summer and winter to conserve soil moisture and protect it in exposed locations or colder microclimates. This species is not originally from North America. It can be propagated by division.

Tiger Grass is a fine choice for the garden, but it is also a good selection for planting in outdoor pots and containers. With its upright habit of growth, it is best suited for use as a 'thriller' in the 'spiller-thriller-filler' container combination; plant it near the center of the pot, surrounded by smaller plants and those that spill over the edges. It is even sizeable enough that it can be grown alone in a suitable container. Note that when growing plants in outdoor containers and baskets, they may require more frequent waterings than they would in the yard or garden.
