

### Siberian Pine

*Pinus sibirica*

Height: 50 feet

Spread: 10 feet

Sunlight: ☐

Hardiness Zone: 1b

#### Description:

A broadly pyramidal evergreen perfect for screening; luxurious green needles are held on upswept branches that are compact and dense; excellent also as an accent in a large landscape

#### Ornamental Features

Siberian Pine is primarily valued in the landscape for its distinctively pyramidal habit of growth. It has forest green evergreen foliage. The needles remain forest green throughout the winter.

#### Landscape Attributes

Siberian Pine is a dense multi-stemmed evergreen tree with a distinctive and refined pyramidal form. Its relatively fine texture sets it apart from other landscape plants with less refined foliage.

This is a relatively low maintenance tree. When pruning is necessary, it is recommended to only trim back the new growth of the current season, other than to remove any dieback. It is a good choice for attracting birds to your yard, but is not particularly attractive to deer who tend to leave it alone in favor of tastier treats. It has no significant negative characteristics.

Siberian Pine is recommended for the following landscape applications;

- Accent
- Mass Planting
- Hedges/Screening
- Windbreaks and Shelterbelts

**Planting & Growing**

Siberian Pine will grow to be about 50 feet tall at maturity, with a spread of 10 feet. It has a high canopy with a typical clearance of 6 feet from the ground, and should not be planted underneath power lines. As it matures, the lower branches of this tree can be strategically removed to create a high enough canopy to support unobstructed human traffic underneath. It grows at a medium rate, and under ideal conditions can be expected to live to a ripe old age of 100 years or more; think of this as a heritage tree for future generations!

This tree should only be grown in full sunlight. It prefers dry to average moisture levels with very well-drained soil, and will often die in standing water. It is considered to be drought-tolerant, and thus makes an ideal choice for xeriscaping or the moisture-conserving landscape. It is not particular as to soil type or pH. It is highly tolerant of urban pollution and will even thrive in inner city environments. This species is not originally from North America.
