

White Alder

Alnus rhombifolia

Height: 60 feet

Spread: 40 feet

Sunlight: ☐ ☒

Hardiness Zone: 8

Description:

A handsome, medium-sized tree presenting dark green, shiny foliage and smooth, pale gray bark when young; yellow catkins in spring followed by clusters of brown fruiting cones that persist up to a year; be careful about location, roots are aggressive

Ornamental Features

White Alder features showy clusters of chartreuse catkins hanging below the branches from early to mid spring before the leaves. The dark brown fruits are held in abundance in spectacular cones from late summer to late winter. It has dark green foliage with chartreuse undersides which emerges light green in spring. The glossy oval leaves turn outstanding shades of yellow and in the fall. The smooth gray bark and dark brown branches add an interesting dimension to the landscape.

Landscape Attributes

White Alder is a multi-stemmed deciduous tree with an upright spreading habit of growth. Its average texture blends into the landscape, but can be balanced by one or two finer or coarser trees or shrubs for an effective composition.

This is a relatively low maintenance tree, and is best pruned in late winter once the threat of extreme cold has passed. It is a good choice for attracting birds and bees to your yard. Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Suckering
- Insects

White Alder is recommended for the following landscape applications;

- Accent
- Shade
- Hedges/Screening
- Naturalizing And Woodland Gardens
- Bog Gardens

Planting & Growing

White Alder will grow to be about 60 feet tall at maturity, with a spread of 40 feet. It has a low canopy with a typical clearance of 4 feet from the ground, and should not be planted underneath power lines. It grows at a fast rate, and under ideal conditions can be expected to live for 80 years or more.

This tree does best in full sun to partial shade. It is quite adaptable, preferring to grow in average to wet conditions, and will even tolerate some standing water. It may require supplemental watering during periods of drought or extended heat. This plant is capable of fixing its own nitrogen, which means that it is effectively self-fertilizing. As a result it should not require supplemental fertilizing, and if you do fertilize it, be sure to only use a low-nitrogen fertilizer to promote root growth. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. This species is native to parts of North America.
